This document contains: (1) product images of recreational *Cannabis* flower samples, with insets featuring samples of the marijuana flower; (2) DART mass spectra (collected in positive-ion mode), structures, $[M+H]^+$ chemical formulas, and corresponding protonated masses of cannabinoids known to be in *Cannabis sativa* products; (3) DART mass spectra (collected in negative-ion mode), structures, $[M-H]^-$ chemical formulas, and corresponding deprotonated masses of cannabinoids known to be in *Cannabis sativa* products; (4) DART mass spectra (collected in positive-ion mode) of the remaining edibles, capsules, and pre-rolls not featured in **Figure 3** of the main document, with photographs of the products featured in the insets; (5) DART mass spectra (collected in negative-ion mode) for all non-flower *Cannabis* products (i.e., edibles, capsules, oils, tinctures, vape products, topicals, concentrates, and pre-rolls), with photographs of the products featured in the insets; (6) table of DART mass spectral data (collected in positive-ion mode) consistent with cannabinoids and terpenes reported in the recreational *Cannabis* products; (7) table of DART mass spectral data (collected in negative-ion mode) consistent with cannabinoids reported in the recreational *Cannabis* products; (8) DART mass spectra (collected in negative-ion mode) of the recreational *Cannabis* flower samples, with photographs of the flower shown in the insets; and (9) DART mass spectra (collected in negative-ion mode) of the edible candies prepared in-house from our previous study.

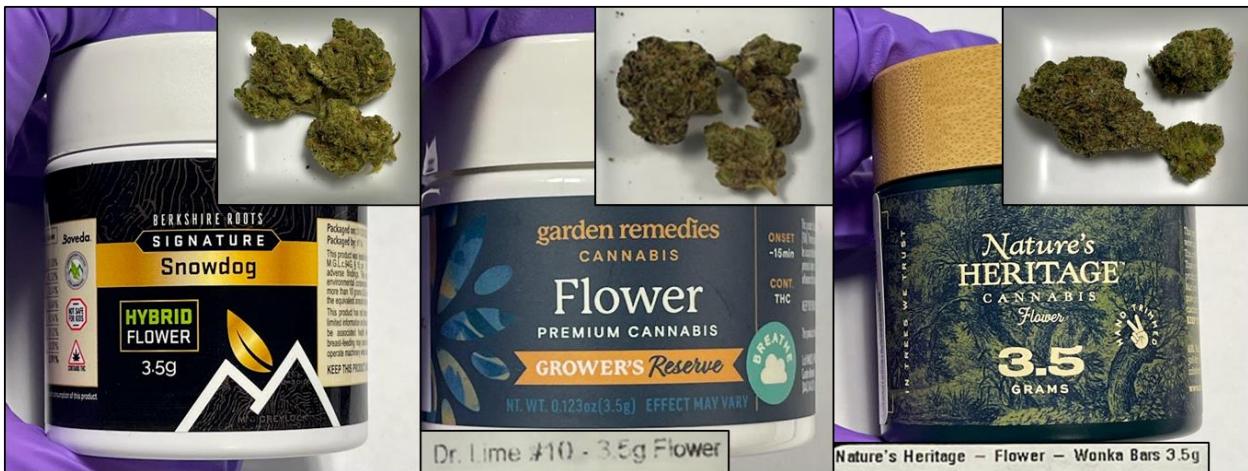

Figure S1. Product images of recreational *Cannabis* flower samples, with insets featuring the samples of the marijuana flower.

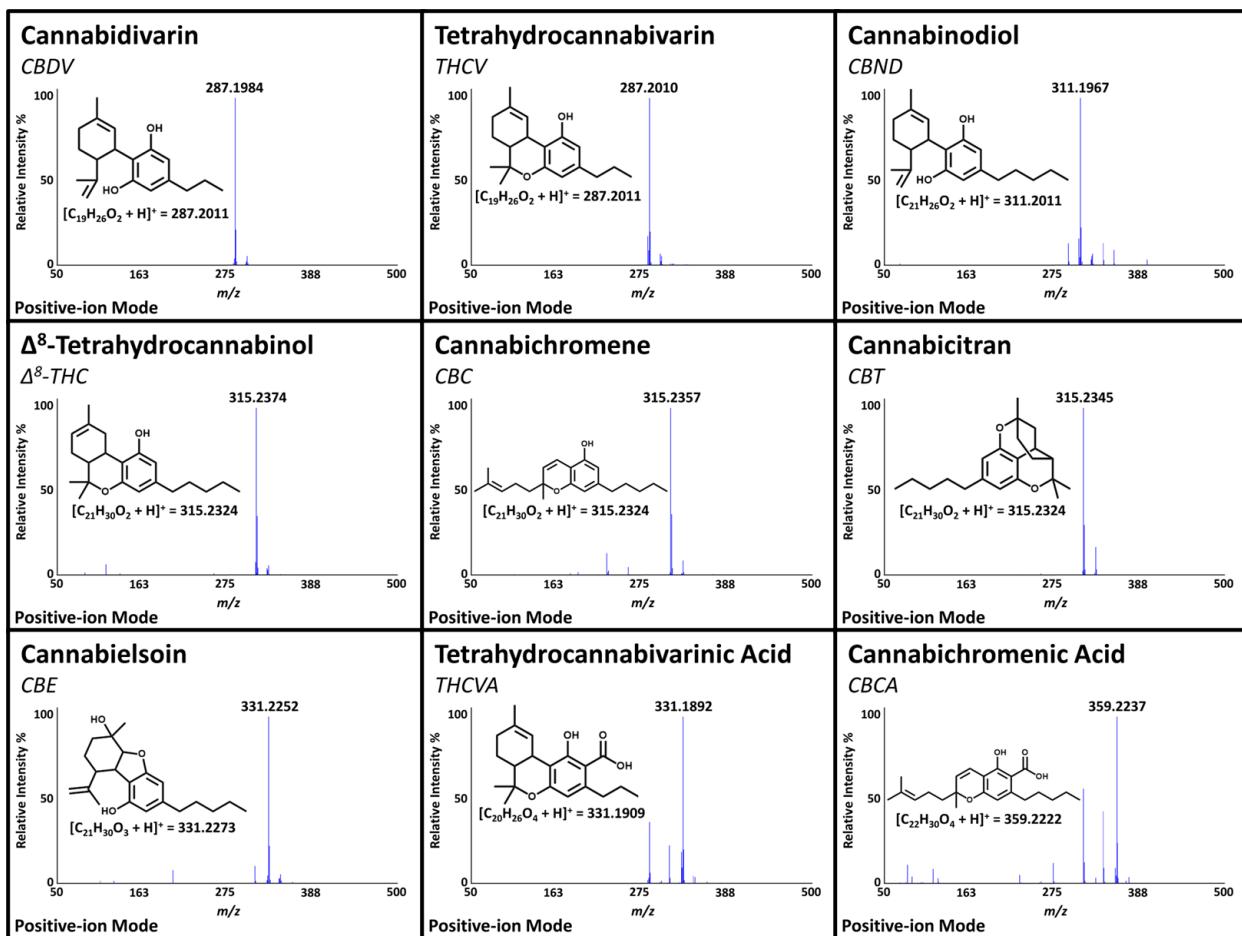

Figure S2. DART mass spectra (collected in positive-ion mode at an orifice 1 voltage of 20 V), structures, $[M+H]^+$ chemical formulas, and corresponding protonated masses of cannabinoids known to be in *Cannabis sativa* products.

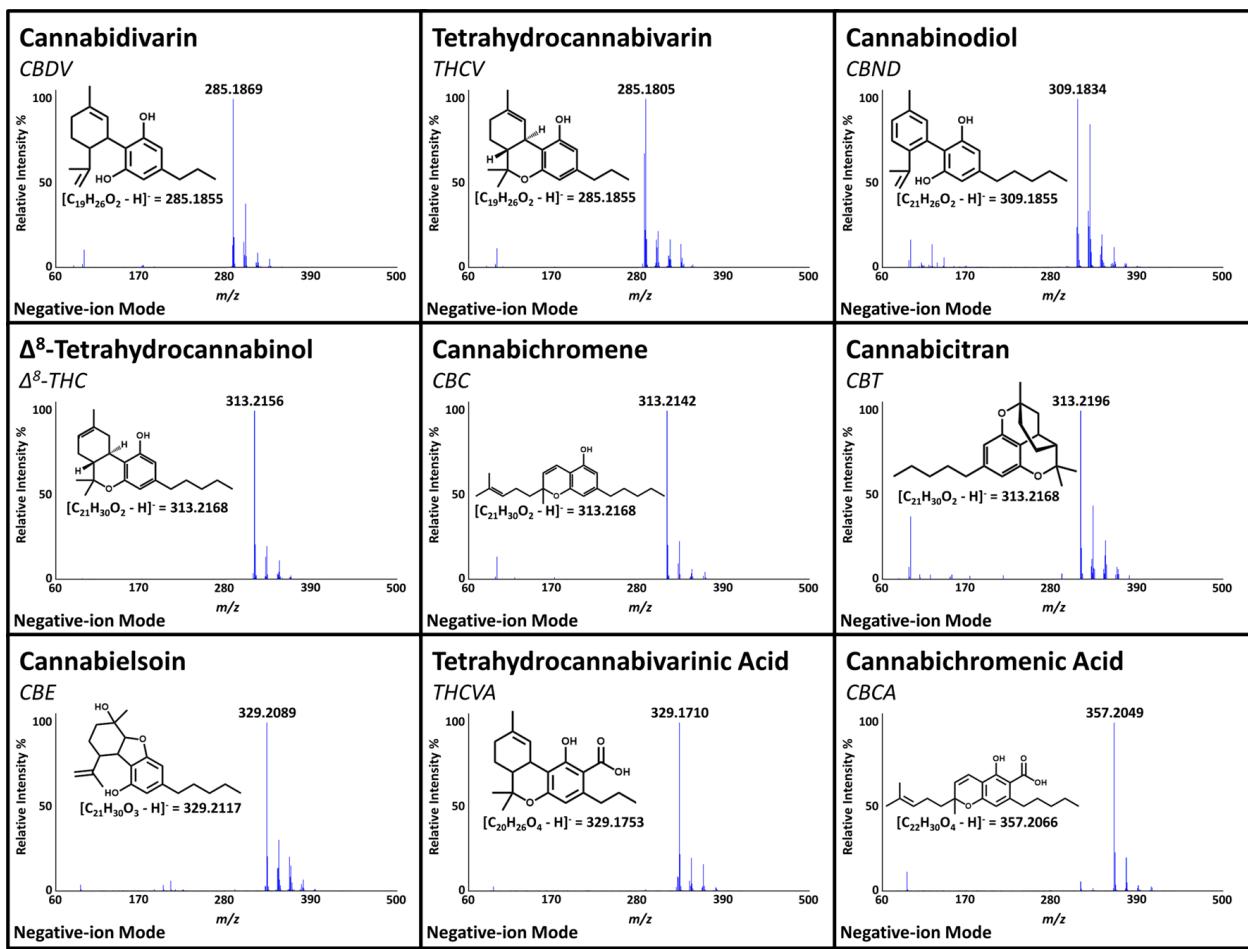

Figure S3. DART mass spectra (collected in negative-ion mode at an orifice 1 voltage of -20 V), structures, $[M-H]^-$ chemical formulas, and corresponding deprotonated masses of cannabinoids known to be in *Cannabis sativa* products.

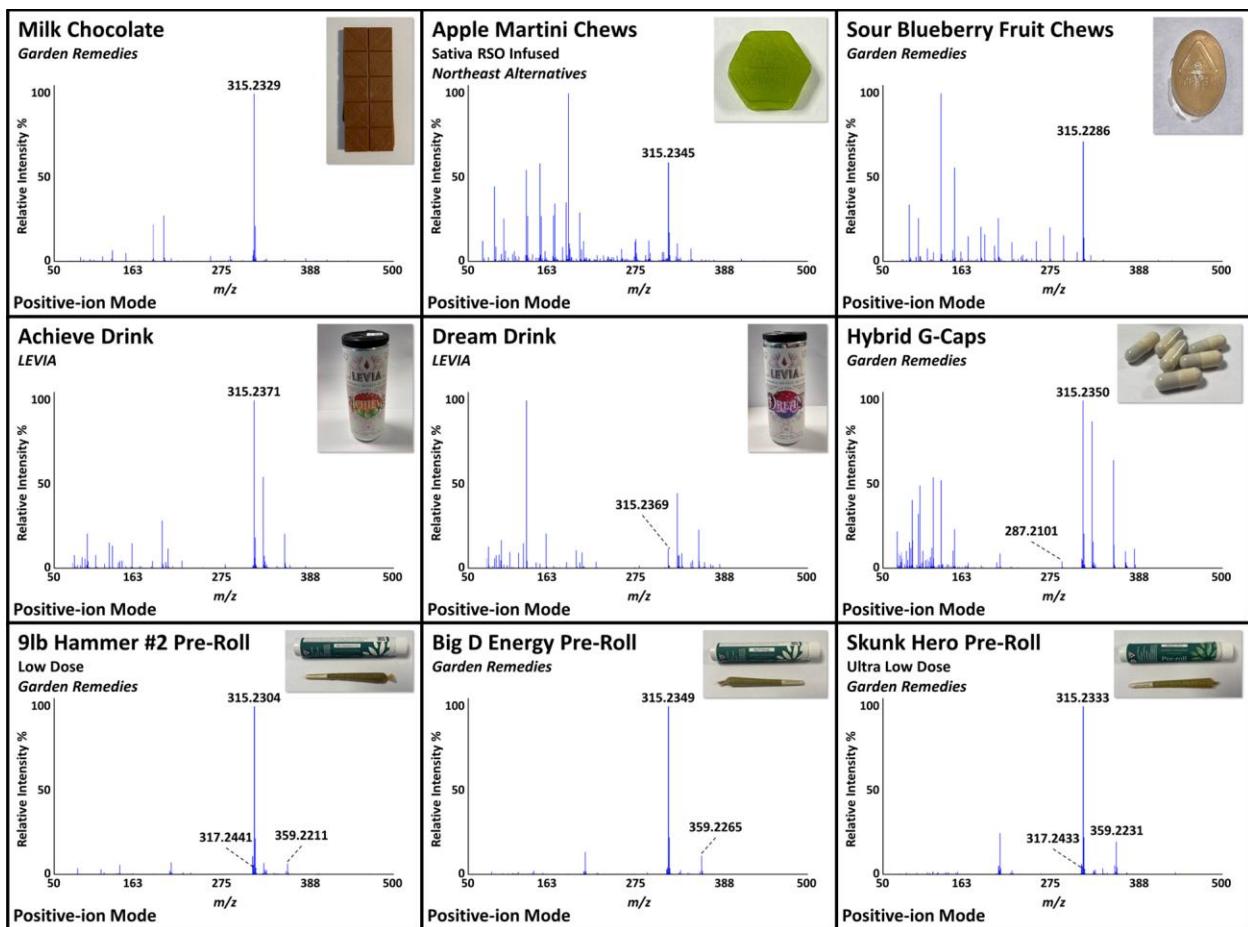

Figure S4. DART mass spectra (collected in positive-ion mode at an orifice 1 voltage of 20 V) of the remaining edibles, capsules, and pre-rolls not featured in **Figure 3** of the main document, with photographs of the products featured in the insets. Peaks consistent with reported cannabinoids are labeled, in addition to those with high relative intensities. Images of the corresponding products are shown in the insets.

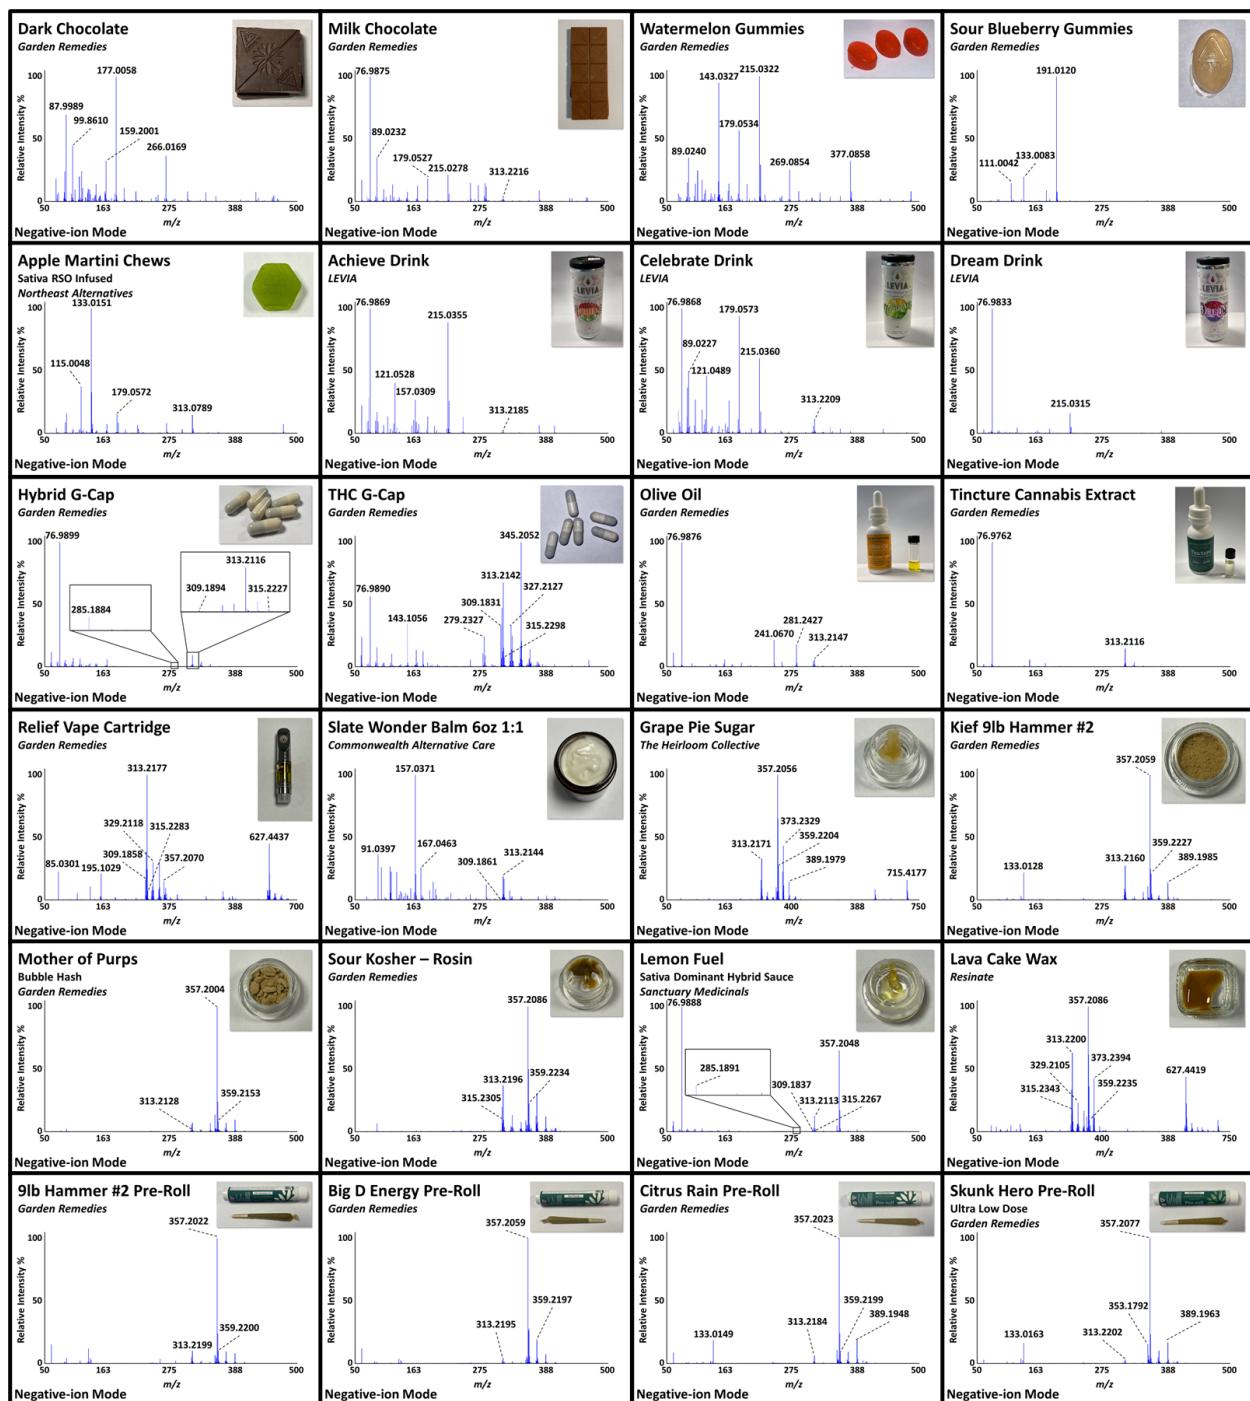

Figure S5. DART mass spectra (collected in negative-ion mode at an orifice 1 voltage of -20 V) for all non-flower *Cannabis* products (i.e., edibles, capsules, oils, tinctures, vape products, topicals, concentrates, and pre-rolls), with photographs of the products featured in the insets. Peaks consistent with reported cannabinoids are labeled, in addition to those with high relative intensities. Images of the corresponding products are shown in the insets.

Table S1. Detection of m/z values representing protonated masses consistent with cannabinoids and terpenes reported to be present in various recreational *Cannabis* products analyzed by DART-HRMS in positive-ion mode.

*Compound identities are tentatively assigned based on calculated/measured masses, and compounds reported as present on product labels.

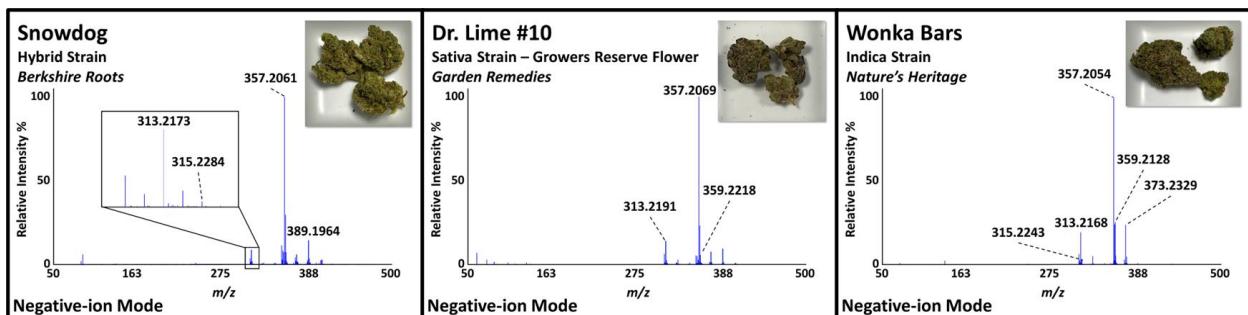

Figure S6. DART mass spectra (collected in negative-ion mode at an orifice 1 voltage of -20 V) of the recreational *Cannabis* flower samples, with photographs of the flower shown in the insets. Peaks consistent with reported cannabinoids are labeled. Images of the corresponding products are shown in the insets.

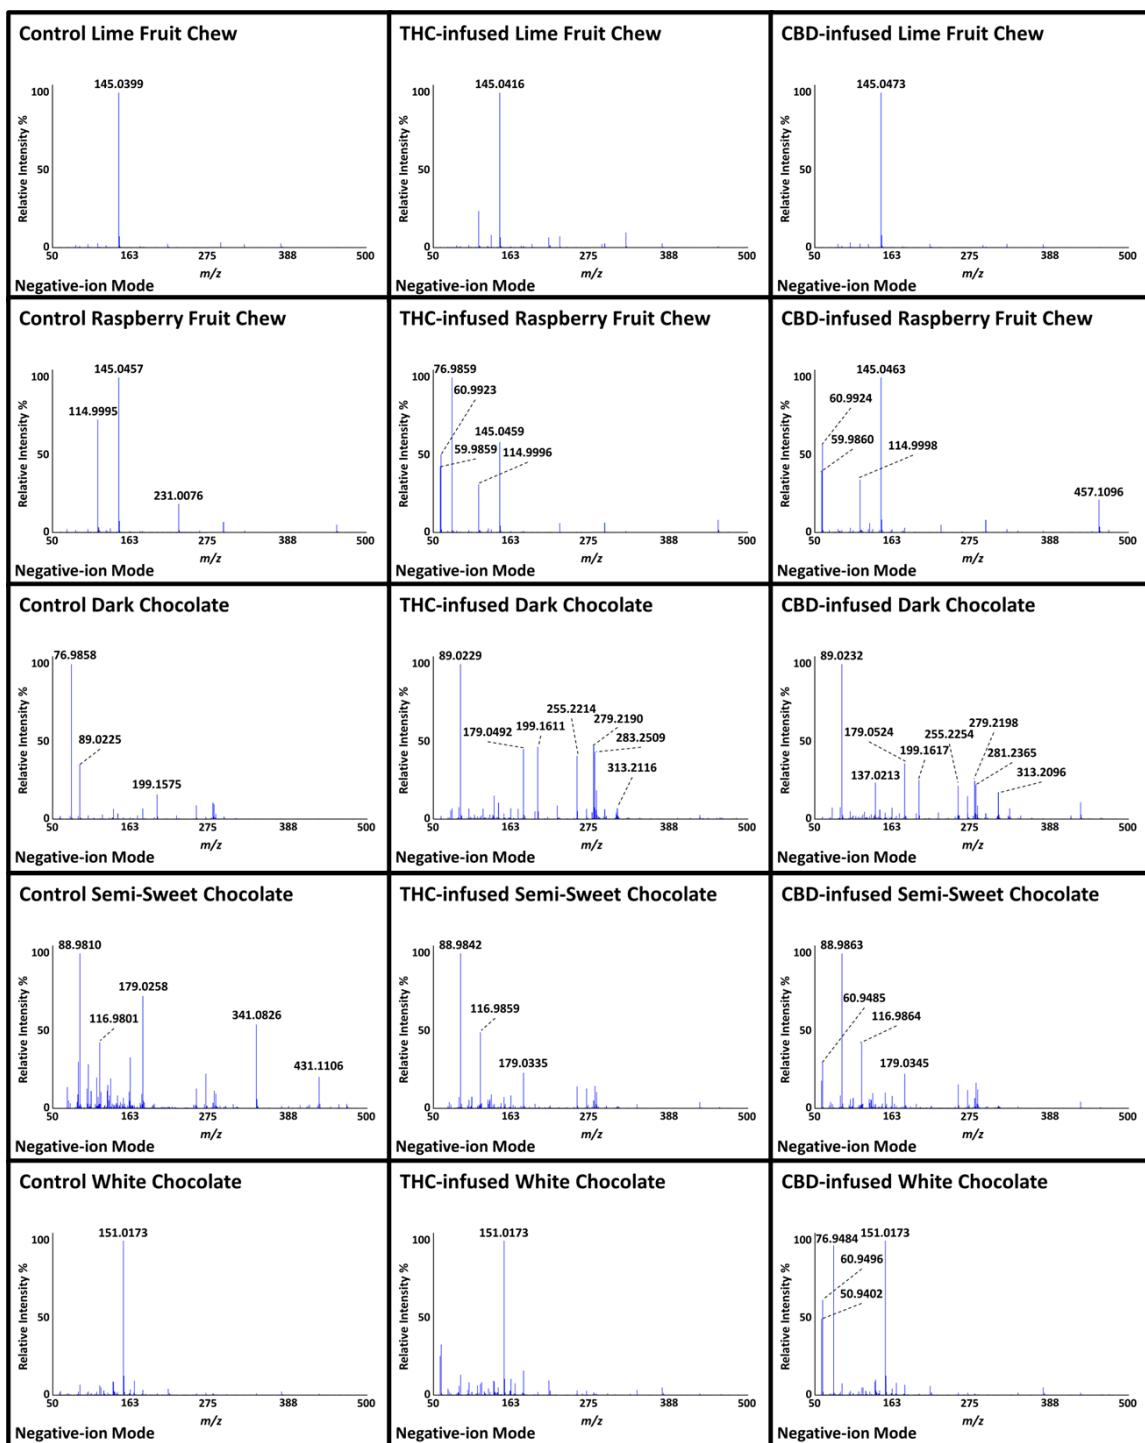

Figure S7. DART mass spectra (collected in negative-ion mode at an orifice 1 voltage of -20 V) of the edible candies prepared in-house from our previous study. Only the THC- and CBD-infused dark chocolates produced peaks within 10 mmu of the mass consistent with deprotonated THC/CBD.
